

katpoint vs CALC (SP-766)

Ludwig Schwardt, SPAZA
26 May 2020

Software

- AlmaCalc11
- katpoint
- Astropy

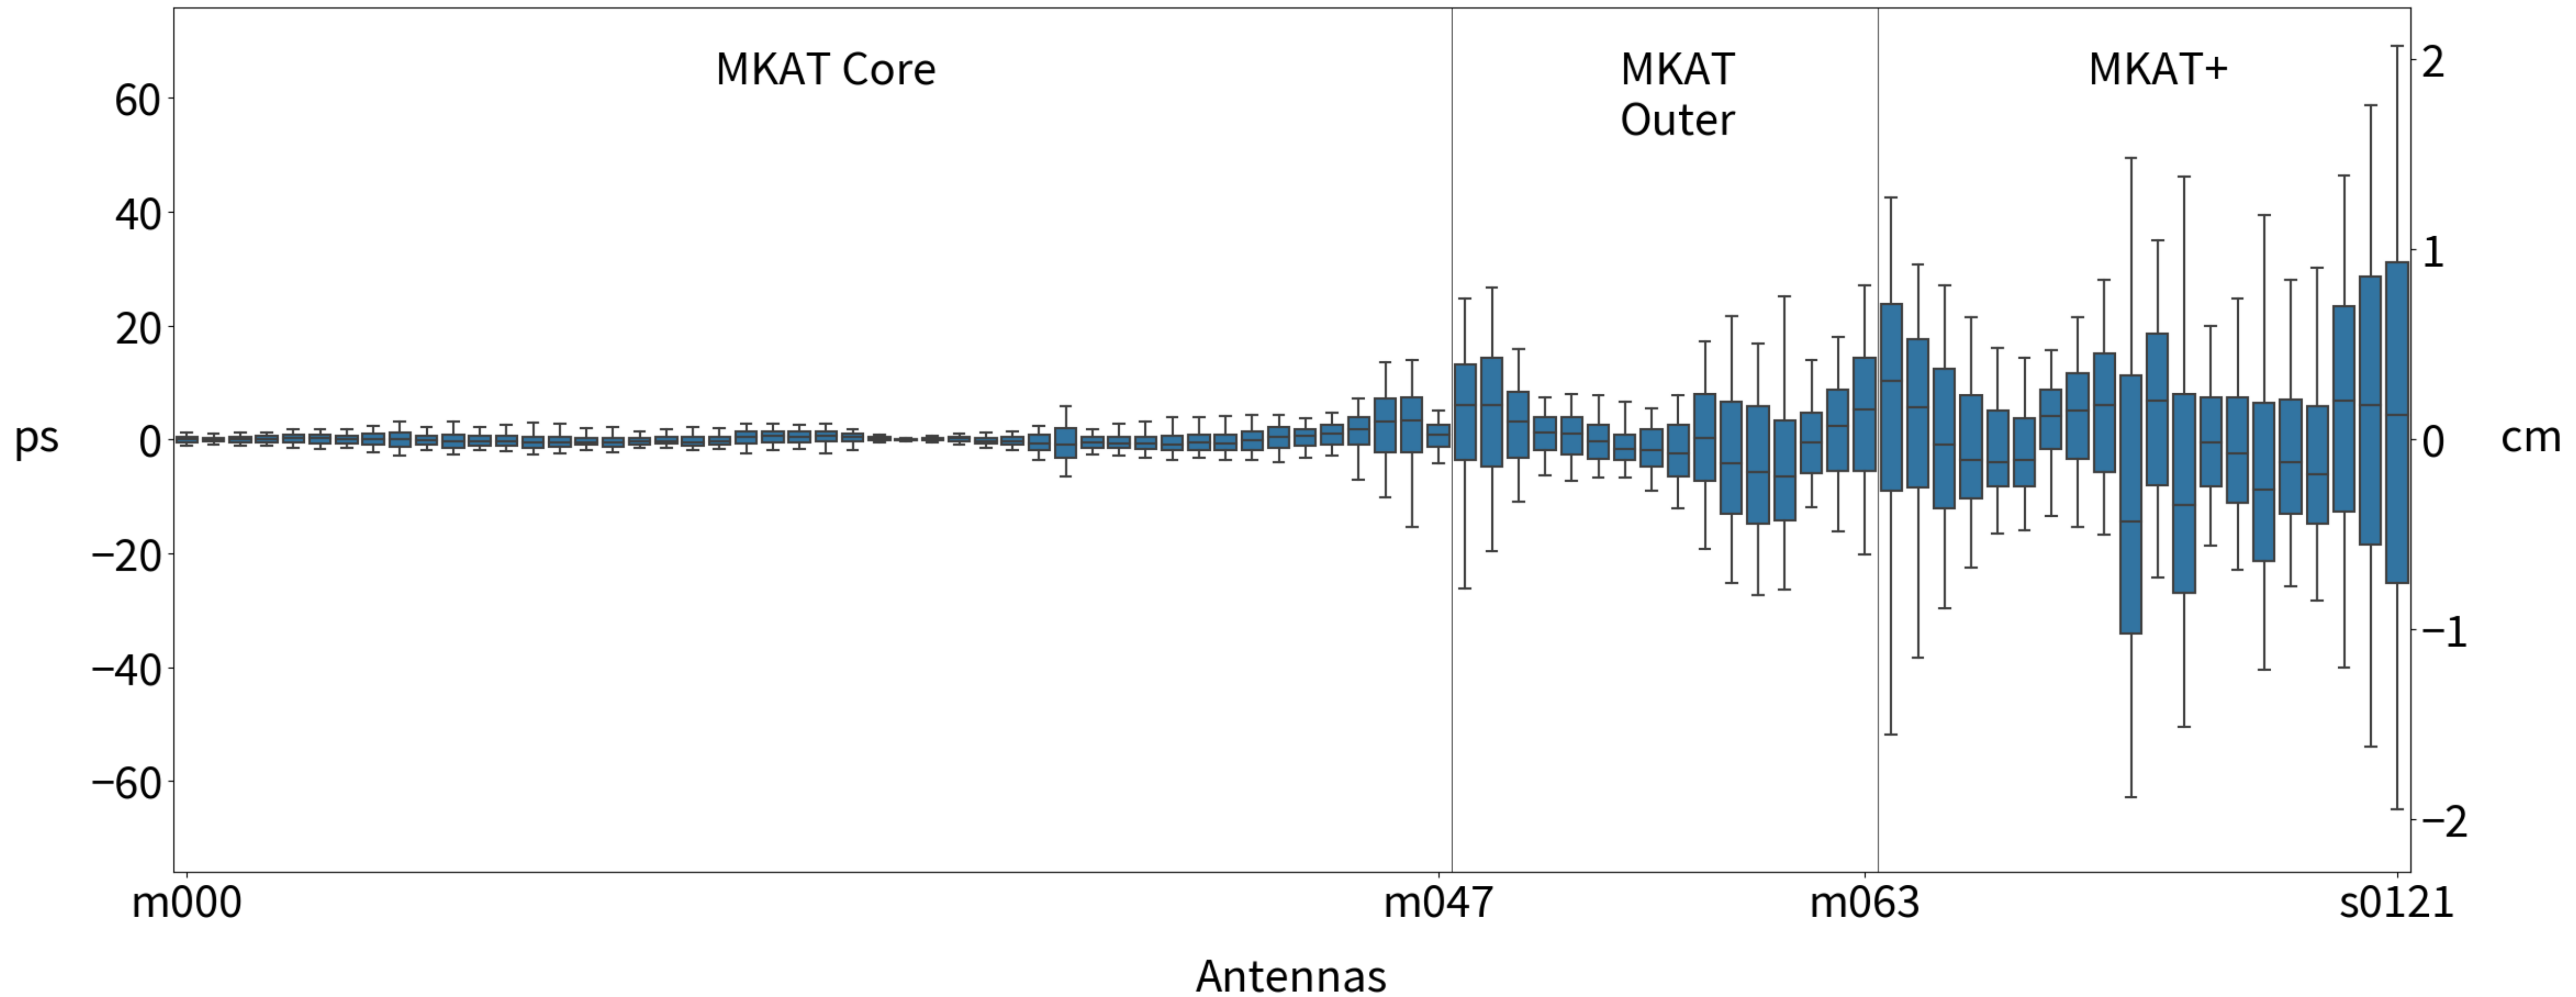

Types of Delays

- Geometric
- Atmospheric
 - Tropospheric
 - Ionospheric
- (Electronic / cable)

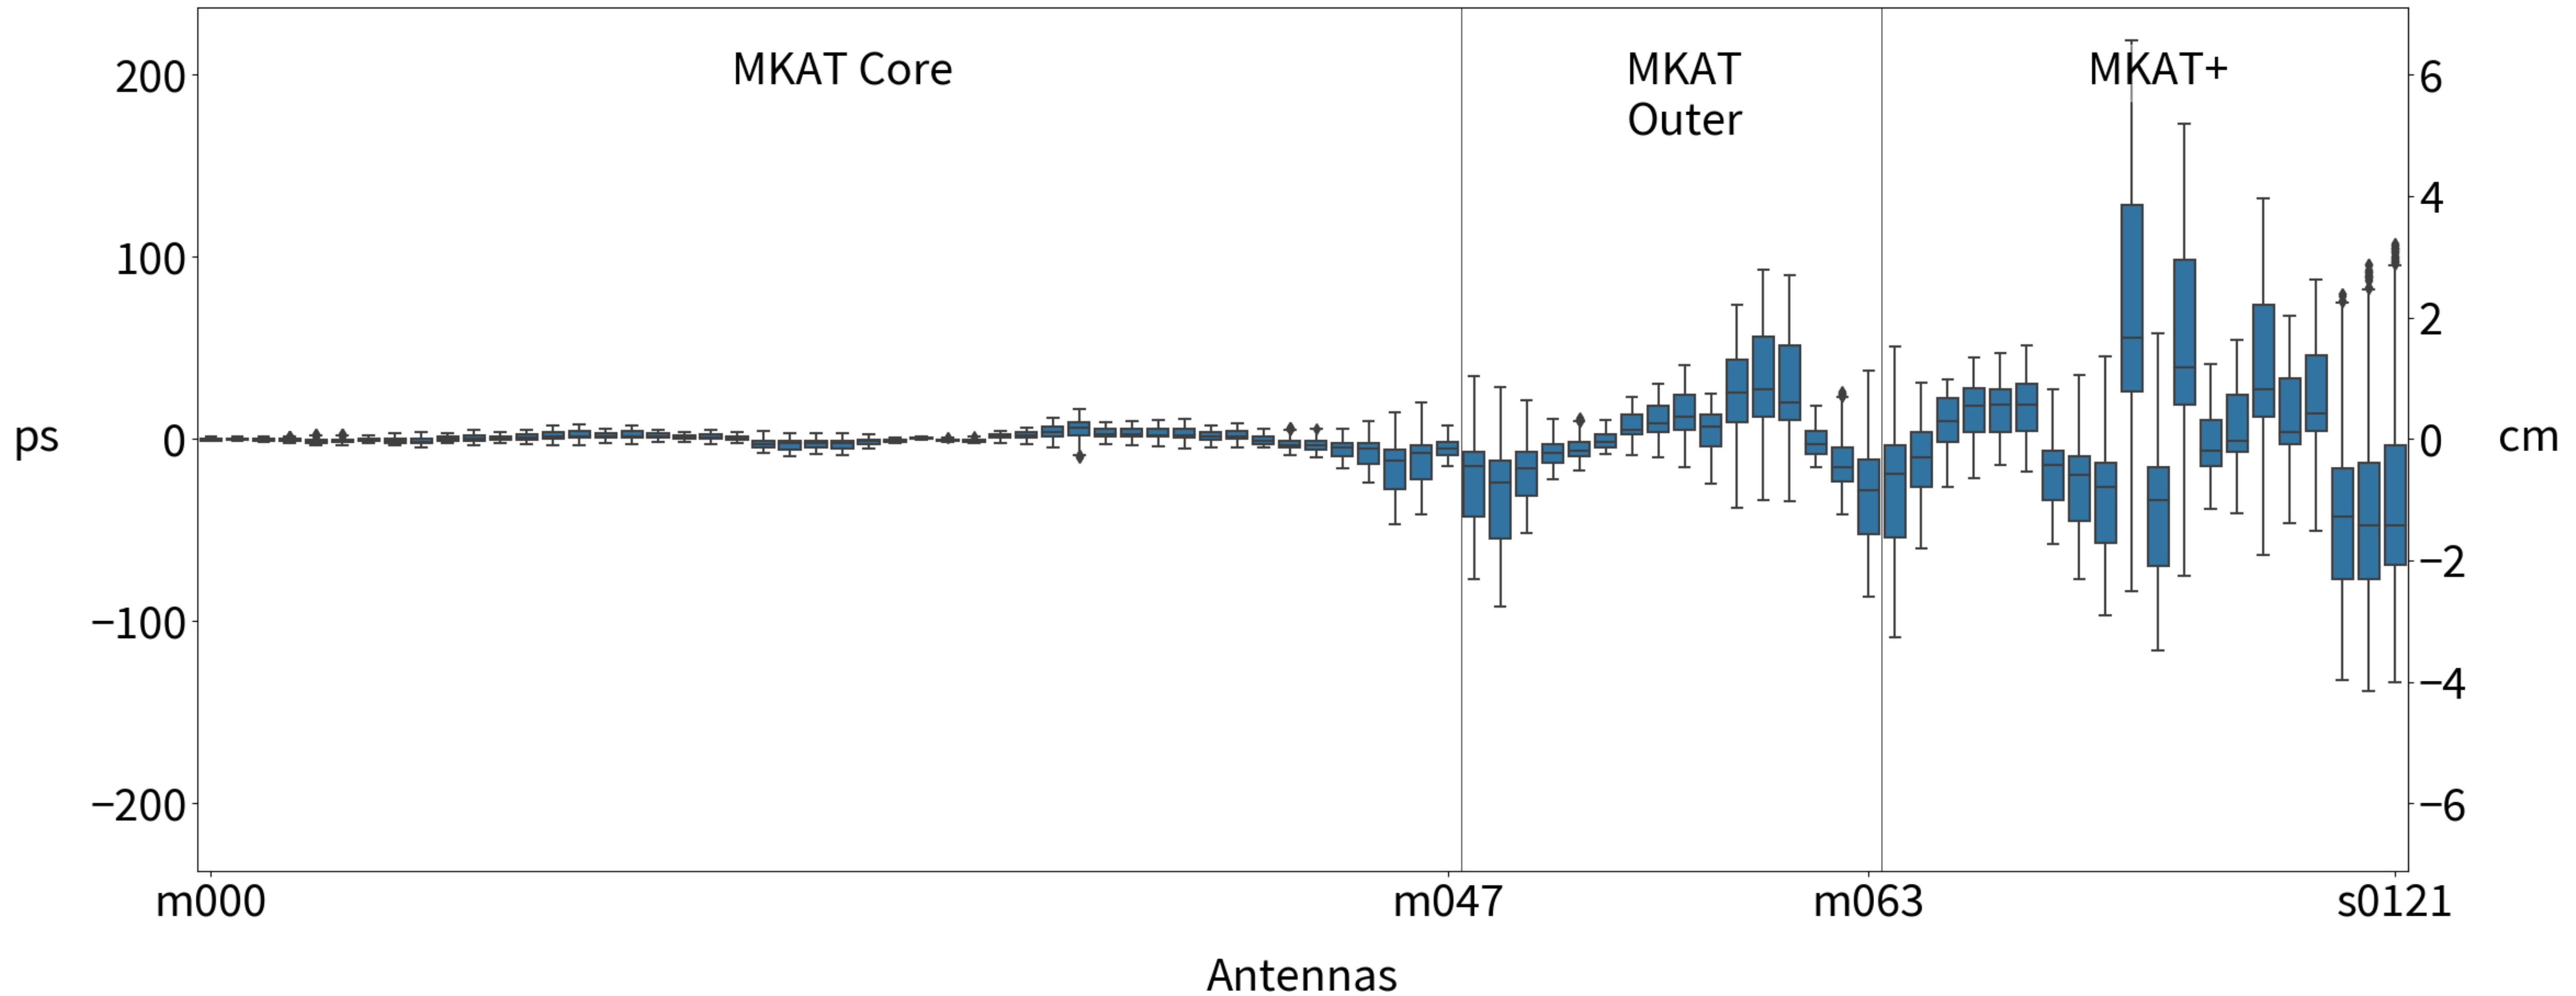

Geometric delays

- AlmaCalc11 has the whole gamut of features:
 1. ITRF, ICRF, precession, nutation (Solar System ephemeris = DE421)
 2. Support for EOPs (UT1 + polar motion, fed from IERS A)
 3. Diurnal spin, solid-earth and pole tides, atmospheric loading, ..., but **no ocean loading + ocean pole tide loading for ALMA**
 4. Troposphere but **no ionosphere**
- Astropy has features 1 and 2 (I think)
- katpoint only has an older version of feature 1

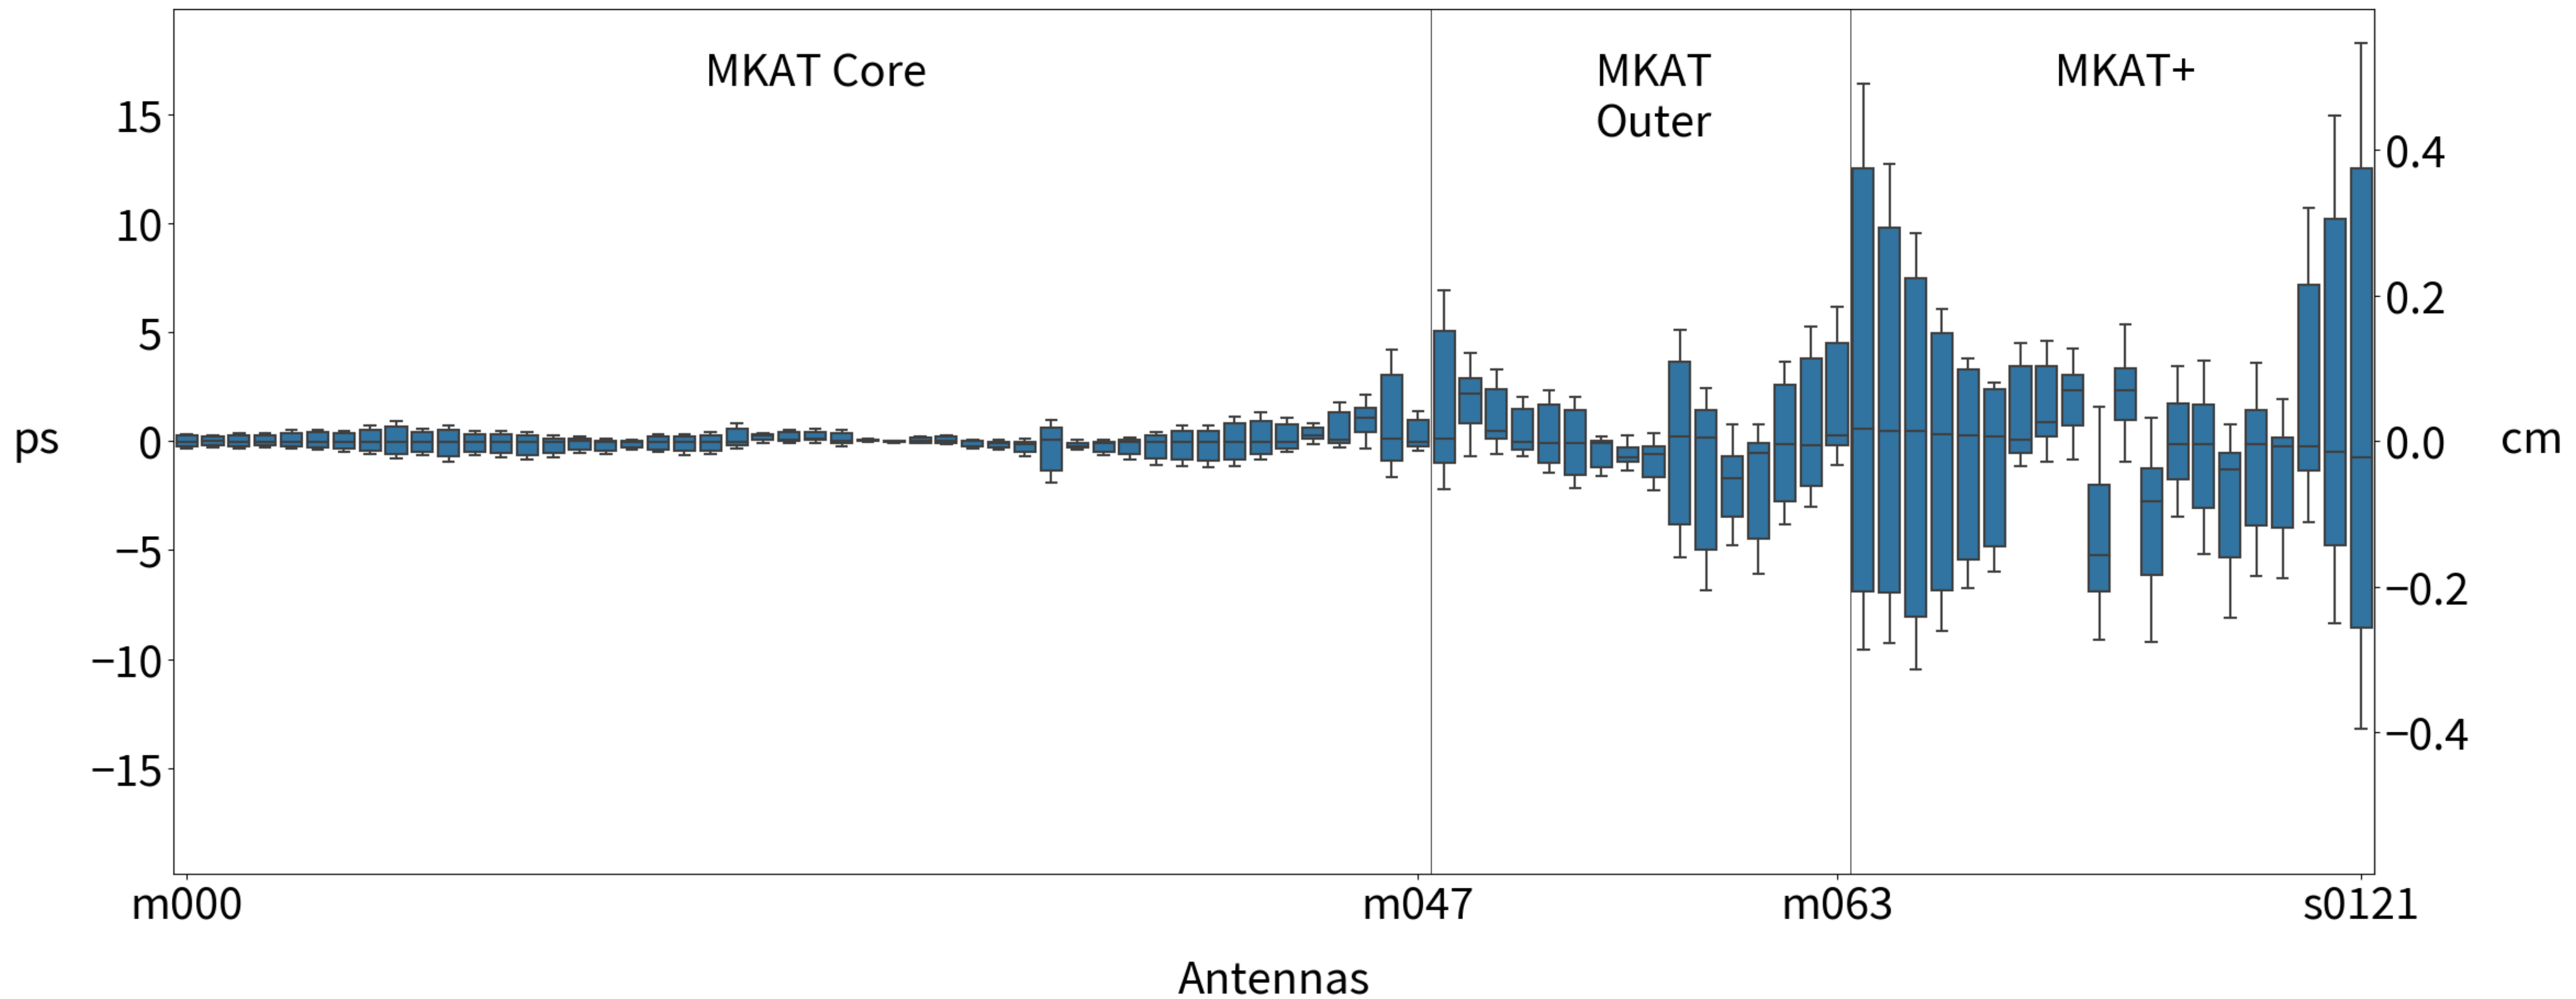

katpoint – CALC (without EOPs)

katpoint – CALC (with EOPs)

Astropy – CALC (with EOPs)

Atmospheric delays

Fig. 13.3 Two-element interferometer with the atmosphere modeled as a uniform flat slab. The geometric delay is the same as it would be if the interferometer were in free space. [TMS, 3rd Ed]

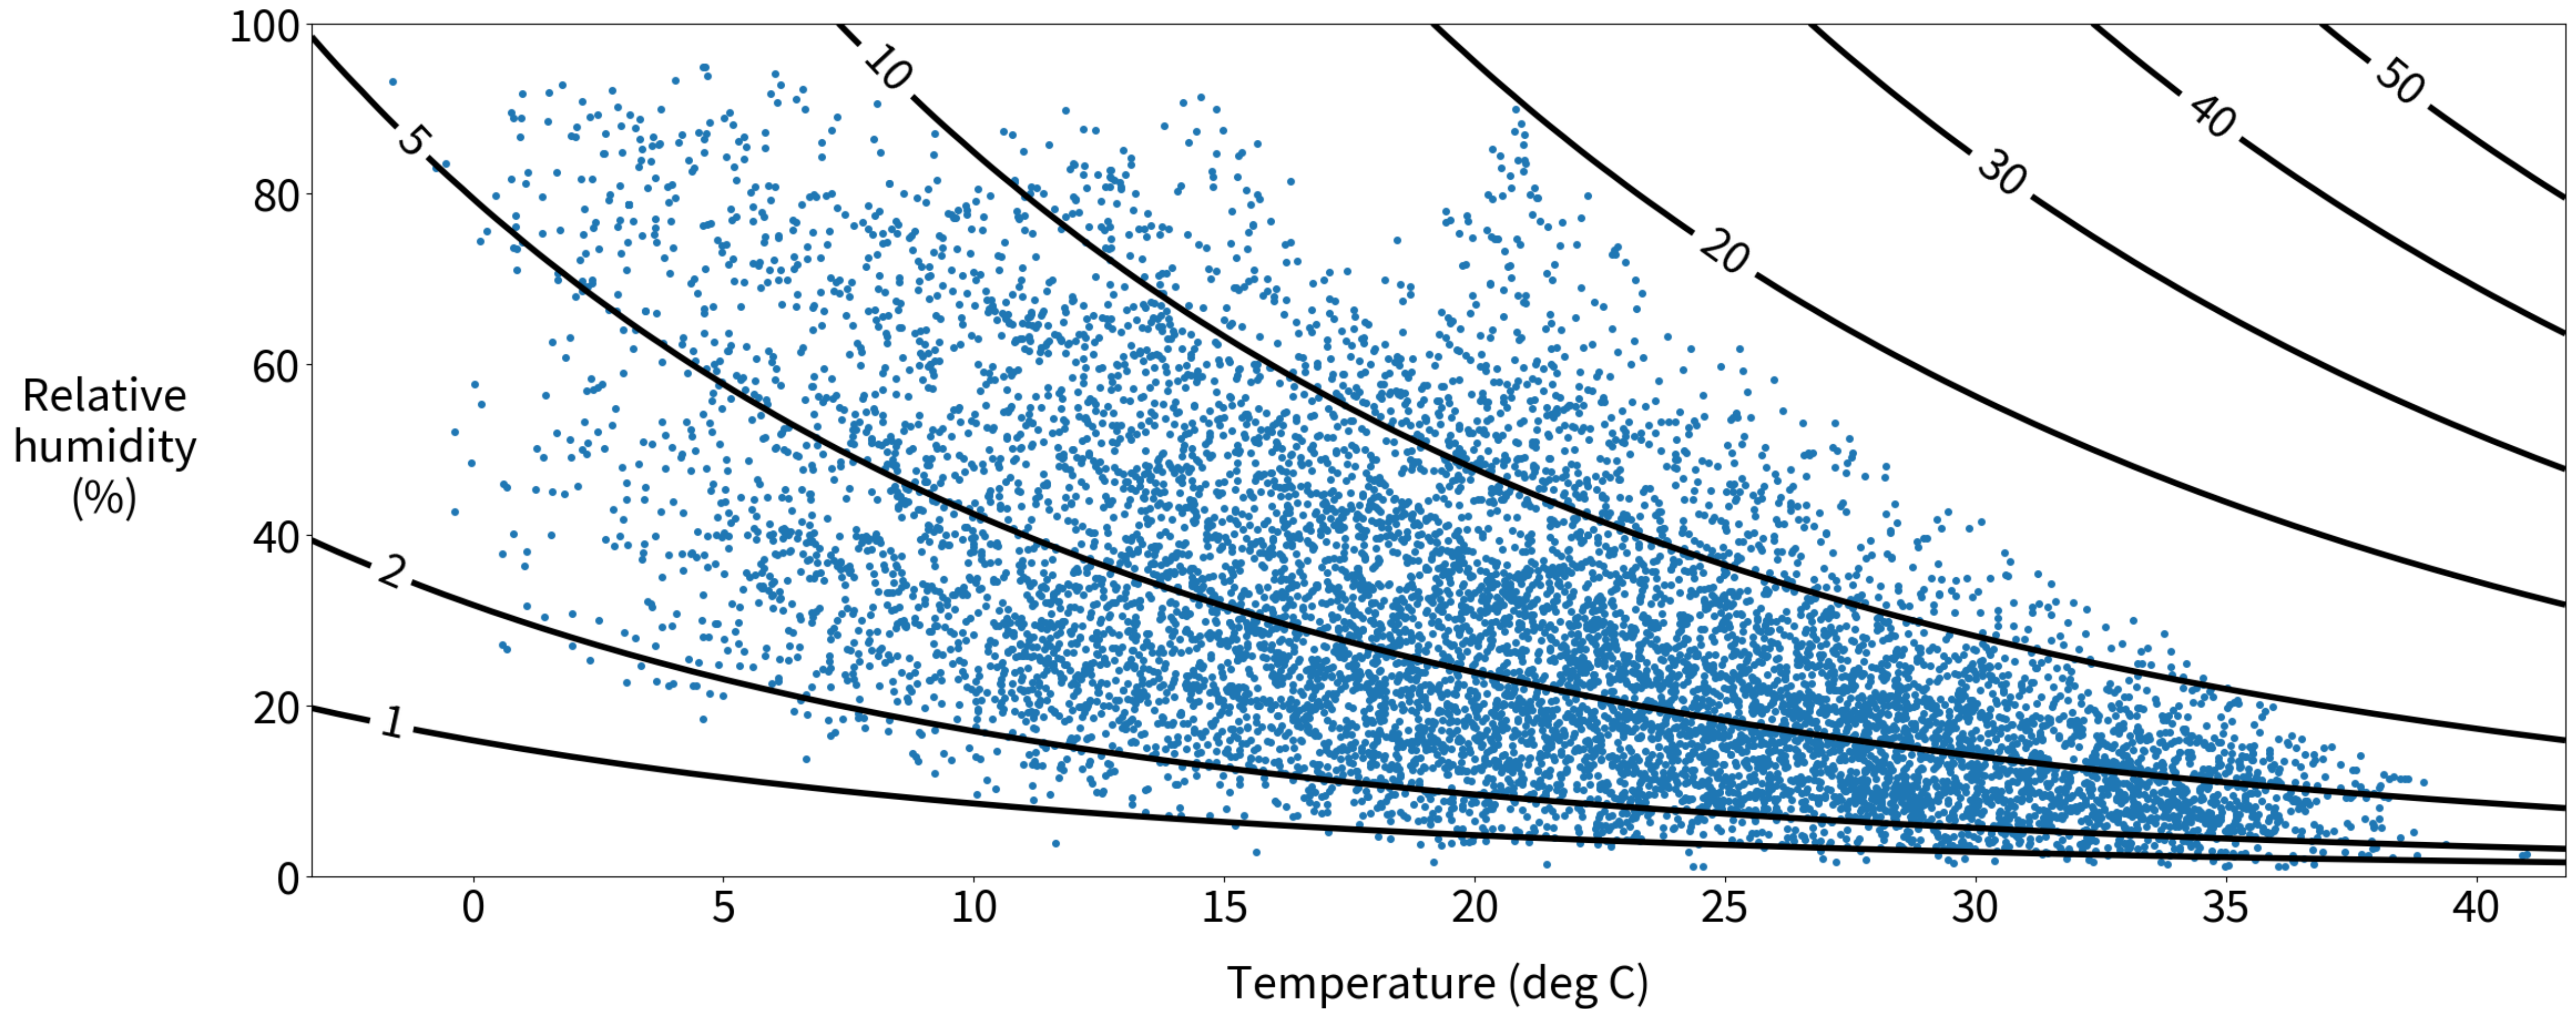

Some overlap with online “debates” 🙄😂

Weather at MeerKAT site

Wet excess zenith path length (cm)

Path lengths in the troposphere

Dry excess path length at MeerKAT site

Wet excess path length at MeerKAT site (21 deg C)

Maximum dry differential path length for 20 km baseline

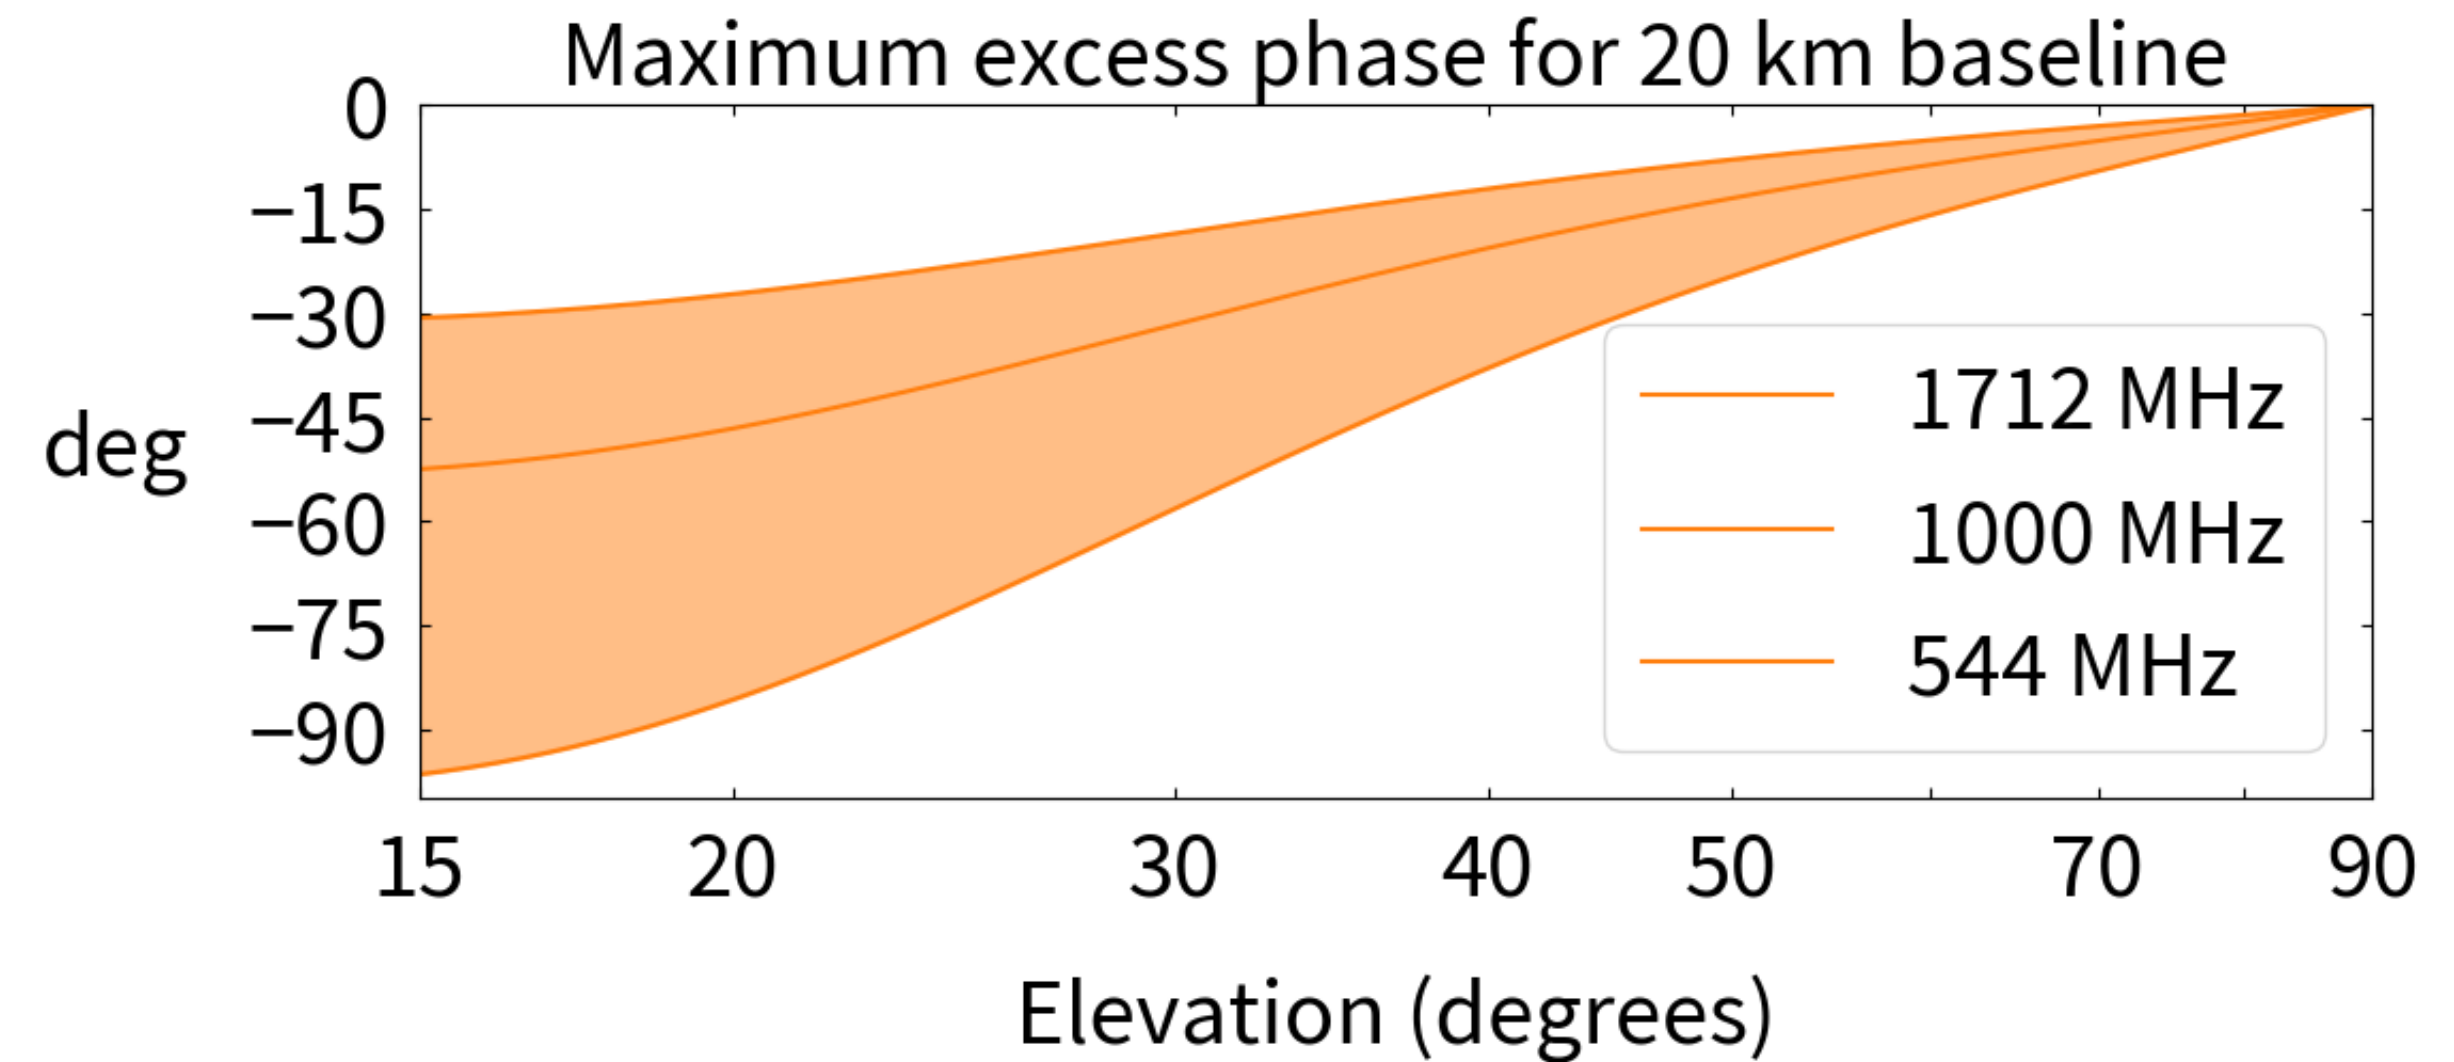

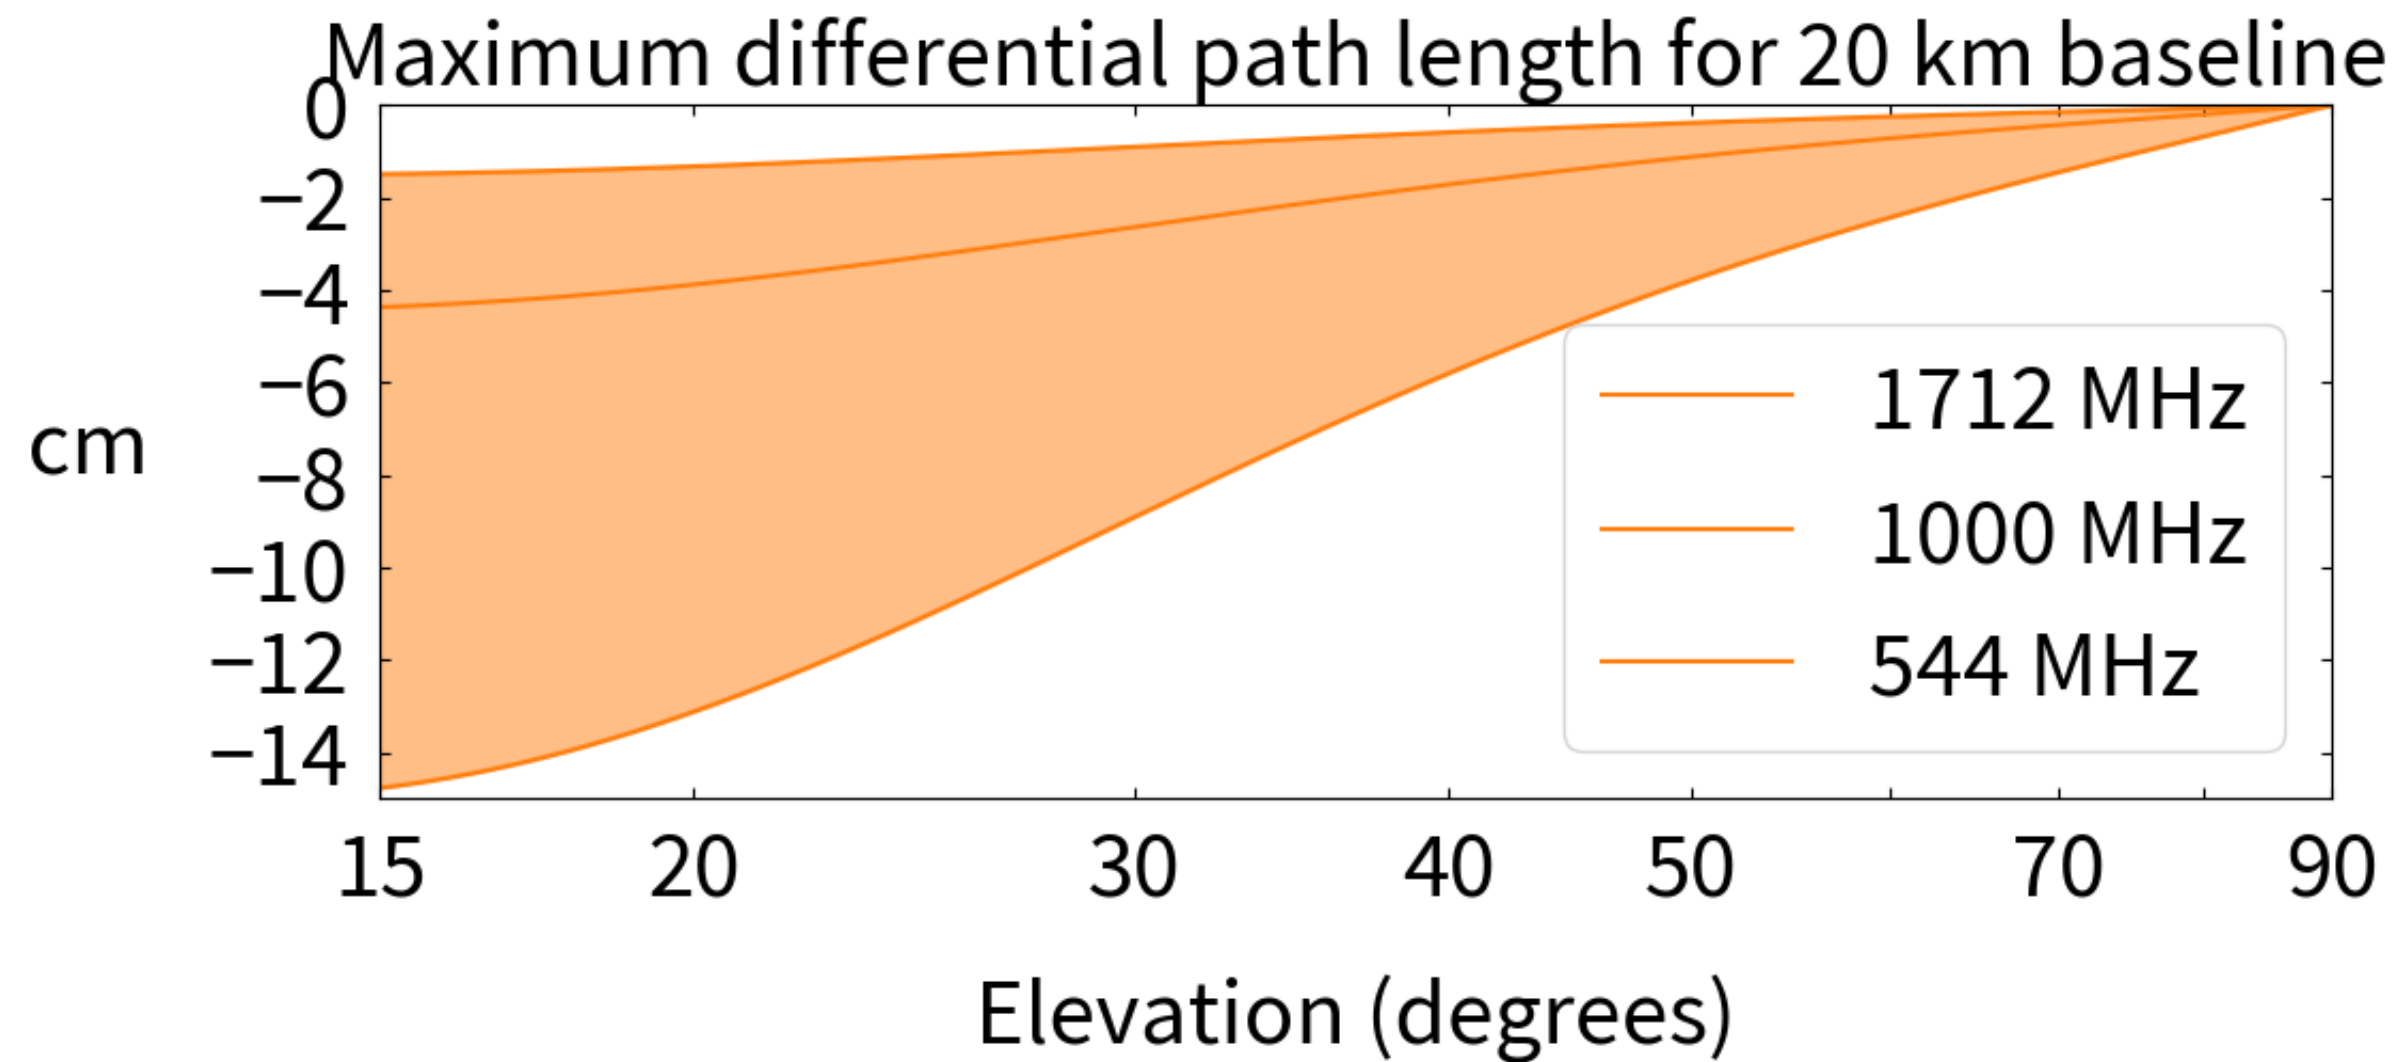

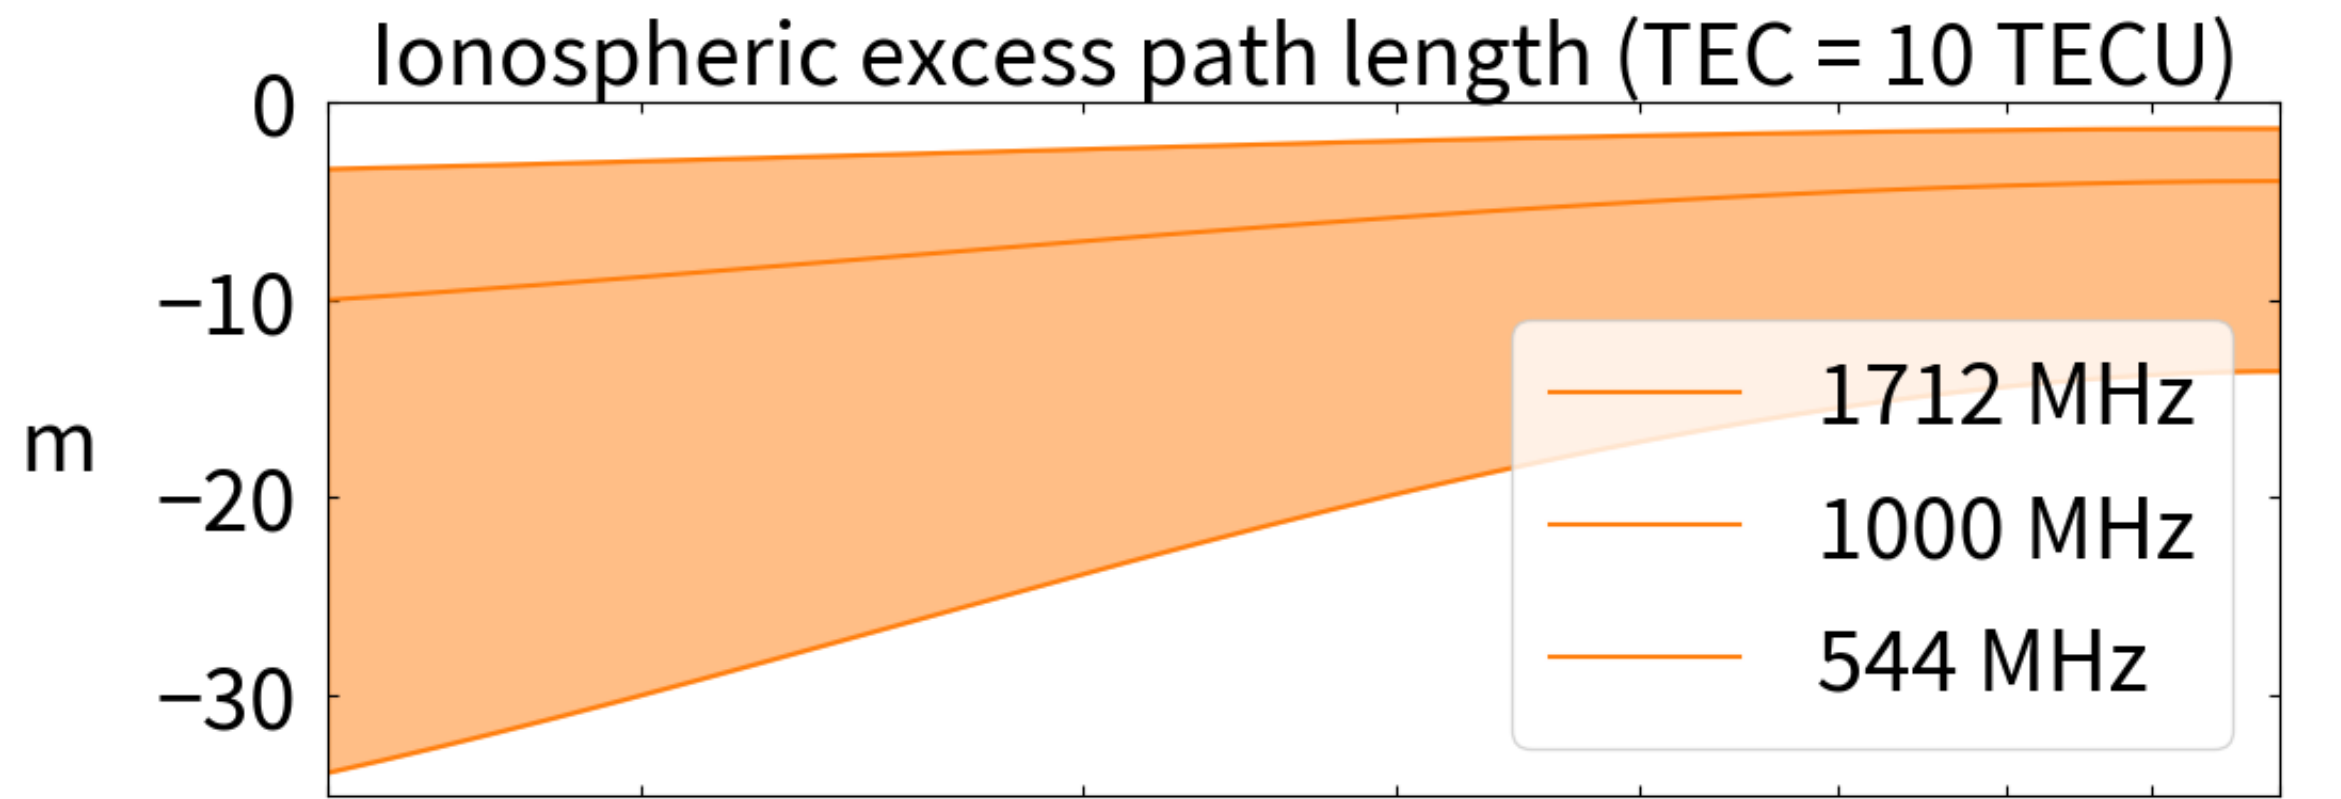

Maximum wet differential path length for 20 km baseline

Elevation (degrees)

Elevation (degrees)

Path lengths in the ionosphere

Conclusions

- Use *Astropy* for basic geometry (ITRF, ICRF, precession / nutation, EOPs)
- Investigate additional terms (solid-earth / pole tides, ocean loading, ...)
- Construct a tropospheric model from the best parts of CALC and TMS, e.g. Rüeger refractivity + Crane water vapour + Global mapping function
- Consider ionospheric corrections (VLBI uses GPS maps for astrometry)
- COMPLETE THE MIGRATION of katpoint to *Astropy*!
